LEARNFORLIFE

DESCRIPTION

LearnforLife (LfL) represents a behavioural change methodology with a number of building blocks including incentive schemes, tailored rewards and real-time communication targeting specific behaviours and key audiences.

LfL focuses on empowering individuals to induce self-reinforced processes in regard to healthy behaviour, green behaviour and safe behaviour. Using specially designed e-packages the scheme builds awareness and motivation to engage in behavioural change both on a personal basis as well as on community level.

INNOVATION ASPECT

- Innovation in the application of behavioral science through the integrated approach;
- The systematic methodology to gradually enforced motivation through interactivity;
- The approach to focusing attention on minor and yet significant lifestyle modifications with high impact on well-being and in support of a sustainable environment.

REPLICATION AND SCALABILITY

- The LfL Methodology is best applied in an environment that facilitates rapid communication of motivational messages, handling of responses and feedback;
- Mobile apps can be scaled into new environments;
- Light adaptation of infrastructure, user practices and tools can arrange in consideration of culture and target audiences.

PARTICIPATION PROCESS

CO-DIAGNOSTIC

By implementing LfL, real-time data can be derived for several purposes. These include diagnostics, mapping stakeholders, understanding incentives and underpinning motivations.

CO-SELECTION

LfL can usefully be applied through a process where citizens become effectively involved in co-selection and combination of various complementary NBSs.

CO-DESIGN

The application adds high value within a co-creation process where the engagement of citizens evolved through a process of gradual intensification. Constructive interface between citizens and different stakeholders is further made use of systematically, in support of a successful design of and application of the LfL Methodology.

CO-IMPLEMENTATION

The implementation is preferably preceded by a pilot whereby a small number of users are made to test the product and its relevance in the local context. After fine-tuning, the results of the pilot can be applied more broadly.
